Project Title	<i>Improving the health and wellbeing of older men through gender-based activity interventions: a systematic review of Men in Sheds interventions</i>
Project ID	SPHR-LIL-PH1-MIS
Lead Researchers	Christine Milligan - LiLaC; Lancaster University Chris Dowrick - LiLaC; University of Liverpool
SPHR Collaborators	Sheila Payne, Pam Irwin - LiLaC; Lancaster University David Neary – LiLaC; University of Liverpool
External Collaborators / Partners	Barbara Hanratty - York University Age UK
Start Date	1 May 2012
End Date	31 March 2013
Outline	<p>One in five of the UK population is an older man (aged over 65 years), and although men report better health than women, mortality rates are higher and the number of potential life years lost by men is double that for women. Loneliness and social isolation are common in this age group, and are known to be associated with poor physical and mental health, higher risk of disability, poor recovery from illness and premature mortality. Older men find it harder than women to make friends late in life, and are less likely to join community based social groups that tend to be dominated by women. They also use fewer community health services than women, and are less likely to participate in preventive health activities. This combination of greater needs and lower rates of engagement with services has prompted the third sector to develop a range of interventions specifically targeted at older men. Men in Sheds is one of the fastest growing innovations. Sheds provide a space for older men to meet, socialise, learn new skills and take part in activities with other men. They may also engage men in informal adult learning activity, provide health related information or signposting to relevant services. Many of the Sheds are supported by Age UK, but all are tailored to their local context and not standardised. Hence, a Shed is a complex intervention, with broad aims to improve physical, emotional, social and spiritual health and well-being that go beyond alleviating loneliness or social isolation. Sheds have captured the public imagination, but to date, there is little robust evidence that demonstrates how, and to what extent, Sheds are effective at improving health and wellbeing. Identifying the active core components of Sheds interventions will be particularly important, given the diverse nature of Sheds. To address these issues in we will undertake a systematic review of the literature around social activities specifically targeted at older men and of the Men in Sheds literature in particular. In preparation for Phase 2 of this project, we will also undertake a 'mapping' of the location and contextual characteristics of existing Men in Sheds projects in England.</p> <p>Aim</p> <p>The aim of this project is to apply the principles of the MRC Framework for the design and evaluation of complex interventions to Men in Sheds programmes, in order to produce:</p> <ol style="list-style-type: none"> A systematic review of the evidence for the effectiveness of gendered social activities, and Sheds in particular, at influencing health and wellbeing amongst older men, including differential outcomes by socioeconomic status and for black and minority ethnic groups; Identification of the effective components of a Shed and other gendered social activity interventions; Identification of the practical barriers/facilitators (financial/structural) of Shed and other gendered social activity interventions;

	<p>d) A synthesis of relevant theory on the likely process of change, to support the subsequent evaluation of Shed interventions;</p> <p>e) Review of outcome measures used in studies to assess health and wellbeing outcomes of interventions, to inform the proposed evaluation of Men in Sheds.</p> <p>Methods</p> <p>The research team will work closely with Age UK at all stages of this project, to ensure that the review and subsequent evaluation are sensitive to the needs of Shed funders, organisers and participants. In this phase, a systematic review will be conducted using the principles of the ESRC narrative synthesis guidance, which allows for the inclusion of a diverse body of evidence. The review will involve a search of all published academic research, third sector, local and central government reports and grey literature that focuses on Men in Sheds and related gendered social activities for older men. Studies will be identified by electronic and manual searching, including searching of bibliographies and reference lists of included papers and the identification of, and contact with, research centres, individual experts and activists in the field.</p> <p>Concurrent with the review, Age UK will collaborate with the research team to identify, characterise and map all Sheds in England, in preparation for the proposed evaluation of Sheds.</p>
<p>Findings</p>	<p>Twenty five studies met the inclusion criteria, 15 for Men in Sheds and 11 for other gendered interventions. There was considerable heterogeneity in the outcome measures used across these studies. Most studies were qualitative and/or had small sample sizes and were unable to exclude important sources of bias.</p> <p>These studies provided some evidence that involvement in Men’s Sheds or other gendered interventions has a significant effect on the physical health of older men, but this is limited. There was some evidence on a positive effect on the mental health of older men, based mainly on self-report from participants. There was also some evidence of the beneficial effects of interventions on older men’s wellbeing, although this is limited by the lack of robust longitudinal studies and conceptual imprecision. Finally, there was limited evidence about the acceptability, accessibility and effectiveness of Men in Sheds or other gendered interventions for older men from differing backgrounds, or with specific health conditions.</p> <p>The interpretive data synthesis indicated that the beneficial effects of Men in Sheds are likely to be mediated through reductions in social inclusion and isolation, with voluntary participation leading to the building of friendships, strengthening of social networks and providing a sense of purpose and identity.</p> <p>Conclusions</p> <p>Links between social activity, health and wellbeing exist, but directions of causality are not clearly established. Qualitative research provides insights into the workings of social capital, including the re-creation of masculinity post-retirement. Men’s Sheds and other gendered interventions may play a vital and valued part in the lives of some older men, including promoting ‘health by stealth’. There is an urgent need for high quality research to provide evidence for potential funders and guidance for good practice.</p>
<p>Lay summary</p>	<p>One in five of the UK population is an older man (aged over 65 years), and although men report better health than women, their mortality rates are higher. Loneliness and social isolation are also common in this age group, and are known to be associated with poorer health outcomes. This is important as older men find it harder than women to make friends late in life, and are less likely to join community based social groups that tend to be dominated by women. Impact	<p>Age UK remains committed to supporting Men in Sheds initiatives, and sees the findings of our systematic review as helpful intelligence in making the case for additional funding in this field, as do other independent Shed organisers. We have received numerous requests for copies of our final report from those looking for evidence to support Shed development.</p> <p>Since beginning the study a further 17 Sheds have been developed across England. Bids have also been submitted for funding to support an additional new Shed in Inverness, Scotland and for a Shed attached to a hospice in England.</p>
Funding	£83,249
